

Velocity Web Services Client v3.8.0.920 Release Notes

Copyright© 2020, Identiv. Last updated on April 30th, 2020.

New features and Improvements added:

Photo Call-Up: A new tab called "Photo Call-Up", now every time someone goes through a secure door with their badge the user in Velocity Web can see the credential information comes up automatically, so they can see who accessed the doors available to the current user. A new credential comes up when the latest person passes through the door.

This feature can be personalized by these options:

- Apply a border color to the most recent credential.
- Have available an "All Doors" section where the user will be able to view the information of all the doors that the user has selected (Up to 10 doors).
- Show individual sections for each door (Up to 10 doors).
- View the "Date and Time" from each credential as well as the "Door Name".
- Load Cached entries: when selected, it will show the previous credentials for each door. When the settings are off it will only show the credentials after the time the user logged in.

Add, Delete, and Edit Command Sets: In the Device Control tab under "Velocity Configuration", you will now have the ability to "Add", "Edit" and "Delete" this Command Sets.

Credentials "Preview" and "Print": In the "Enrollment" tab, after selecting a user, you see their information. For each credential they have available we can see a preview of the badge (created previously on Velocity Thick Client) and you can print it via the browser print feature.

Widgets: On "Status Dashboard" tab the user can see specific widgets for:

- Status Viewer: It will give you the status of Ports, Xbox and/or Controllers.
- Door Status: It will give you the status of doors.
- Performance Status: It will give you some information about the Velocity Application Server and Velocity SQL DB Server, like CPU Utilization and Disk Space Utilization.

And now they are all collapsible windows, meaning that the user can hide and show it as the user needs to, and every time they expand it, it refreshes the information on them.

Device Control: In this tab under "DIGI*TRAC Configuration" a "Status" column is available in all the information inside this configuration.

Web Session Time Out Configuration: A user can configure a global session time out for all users. This feature is under "Settings".

New Help option: Now the user can download a help document with everything they need to know about this new version of Velocity Web App.

New full tab for Events: As the name says, now the "Events" are under their own tab, so the user can see the information without visual distractions from other features.

User Role Permission: Velocity Web is currently respecting user permissions in all sections to display data based on User Role/permissions, including Enrollment/Alarms/Events/Velocity Configuration and DIGI*TRAC Configuration.

New Features

Reference ID	Summary
IDAK-250	Have a tab that is specific for Events for a full screen view
